Abstract of JP6165797

PURPOSE: To enable free selection of a lens whose degree is suited for an individual person, and a goggle to be airtight without leakage.

CONSTITUTION: The goggle is designed so that a projecting part 13 is provided on the lens-mounting hole 10 of a frame 1 and a recessed part 22 is provided on the lens lateral part of a lens body 2 with an eyepiece seal 3, and both projecting part and recessed part engage with each other and detached from the other freely. In addition, the eyepiece seal 3 is attached in such a manner that it encloses the outer end part of the lens 20. Further, a protrusion 24 for preventing the lens from slipping out is provided in front of the recessed part 22, if necessary. The lens can be attached after free selection, and the eyepiece seal 3 serves to enclose the outer end part of the lens body 2 tightly, if the goggle is used in a state where pressure is applied, thereby increasing the airtightness.
